

When seconds count, the estate responds as one.

Community-verified emergency response for residential estates — report in one tap, neighbours confirm, security and managers respond, and every incident is recorded.

At 9pm, when something goes wrong, the “system” is a noisy WhatsApp group.

- **Slow.** Critical messages get buried under chatter — security finds out late.
- **Unverified.** A real fire and a false alarm look identical, so people hesitate.
- **Unrecorded.** Afterwards there’s no trail of who reported, who responded, or how long it took.
- **No accountability.** Residents can’t tell if security, the manager, or a vendor actually performed.

Estates already pay for guards, gates and CCTV. The missing piece is the **coordination layer.**

One trusted system instead of a noisy group chat.

REPORT**One tap**

A resident raises an alarm — fire, security, medical — in seconds.

CONFIRM**Neighbours verify**

Verified neighbours confirm it, so it's trusted fast and false alarms are caught.

RESPOND**Escalate**

Climbs on a timer — residents → security → manager — then the right **outside agency** (Fire, LASEMA, ambulance) for fire, medical or intrusion.

RESOLVE**Recorded**

Only the reporter stands it down. Every step is timed and logged.

Installable as a phone app, live the moment an estate joins.

RAISE ALARM

is always one tap away.

Three things a panic button and a group chat can't do.

Community verification

Neighbours confirm an alarm — trusted in seconds, and false alarms are filtered out.

Estate-tenancy model

WatchPoint knows who actually lives where — households, managers, gate identity. A generic app doesn't.

Accountability by design

Every response is timed and recorded. The longer an estate uses it, the more valuable the record.

Built for how Nigerian estates actually run — associations, landlords, dues, vendors — not a Western safety app bolted on.

Sell to the people who already run the estate's security.

WHO PAYS	Estate associations & facility managers (B2B) — they already collect dues and pay for security, so they have budget, authority and the pain.
BEACHHEAD	Gated estates in Lagos (then Abuja, Port Harcourt) — thousands of estates, each tens to hundreds of households.
WHY REACHABLE	Organised (associations, WhatsApp admins, AGMs), already buying security, and referral-friendly — they talk to each other.
EXPANSION BUYERS	Facility-management firms (many estates at once), security vendors as a channel, and — at city scale — agencies and state government.

Per-estate subscription, paid from the security budget they already control.

STREAM	WHAT	WHEN
Estate subscription	Monthly / annual per estate, tiered by size	Day one
Multi-estate (FM firms)	Volume deals with facility-management companies	Near term
Vetted vendor marketplace	Rated providers (tow, plumber, electrician) pay for placement	Phase 2
City / agency licensing	Jurisdiction dashboards + verified incident data	City scale

Deliberately **not** pay-per-emergency — money flows through the community, never a single emergency.

Land one estate. Expand by referral.

LAND One estate Free / discounted pilot via an organised association. Onboard a manager, a few guards, residents.	PROVE The metric Time-to-acknowledge an incident — and a clean record after.	EXPAND Referral & FM firms A working pilot is the best sales rep. One FM company = many estates.	SCALE City Agencies (LASEMA, Fire, Police) + Smart-City programmes; aggregated data becomes a planning asset.
--	---	---	--

Pitched as **“report faster, respond faster, keep a record”** — not “a new governance system.” Governance features come once trust is earned.

Not a mockup — a working, deployed product.

Live

Installable PWA on a real backend
— full report → confirm →
escalate → resolve flow.

17

Tables with row-level security; a
verification model proven by an
automated test suite.

Ready

Seeded with a realistic estate for
live multi-user piloting today.

Try it now: watchpoint-alpha.vercel.app

Estate → city → community governance.

STAGE	PRODUCT	REVENUE UNLOCK
Today	Estate MVP — built & deployed	Estate subscriptions
Next	City-wide: agencies, jurisdictions, PostGIS, public incident map	FM-firm + agency deals
Then	Recognition, performance scores, vendor ratings, governance	Marketplace + premium analytics

At city scale WatchPoint becomes the **verified pipeline between estates and emergency services** — confirmed incidents (not prank calls), exact location, a live map. Fewer wasted dispatches, faster real response, and planning data the state can act on. A paid agency-licensing line **and** a public-safety multiplier — on an architecture that’s wiring, not a rebuild.

Give an estate the coordination layer its security budget is missing.

We're looking for **pilot estates** and **city-stakeholder deployment** — associations, facility managers, and agencies ready to respond as one.
